

Product Vision

For friend groups who want more engaging ways to interact and understand each other, our product is an interactive social game platform that helps them create shared experiences together. Unlike traditional friendship quizzes or party games, the experience is shaped by the group's own choices, votes, and interactions.

CX Vision

Feels like

Relaxed, fun, and a little unexpected — while making everyone feel like they're truly part of the experience.

Key Moment

- Friends join the same session
- Make choices or cast votes
- See each other's different perspectives
- See how these interactions affect characters, relationships, or the story
- The final reveal / shared result

Human always control

Players decide their own choices, votes, and interactions; the AI doesn't define who a person is for the player, nor does it determine the "true nature" of friendships.

Principles

- Player interactions take precedence over AI-generated content
- The AI is responsible for supporting and driving the experience, not replacing the players
- Results should be traceable back to the players' actual choices and interactions
- Users should be able to decline, skip, or change content they don't want to participate in

Summary

Do

- Let players' choices truly shape the experience
- Let the AI act as a Game Master to facilitate interaction
- Keep outcomes transparent and understandable
- Give players sufficient control

Don't

- Let the AI define characters or relationships for players
- Turn players into spectators who merely watch the AI's performance

- Hide how the AI influences outcomes
- Sacrifice player engagement and control for the sake of convenience

Strategy

Diagnosis

Many friends tend to interact in fairly predictable ways, and existing friendship quizzes or party games are often one-time experiences that lack a sense of engagement and personalized shared experiences.

Where to play

This is primarily aimed at groups of friends who already know each other, helping them increase interaction, find new topics of conversation, and create shared experiences.

How to win

Using “Alternate Universe” as the core interactive format, friends can collectively influence character relationships and the story’s progression through choices, voting, and interaction. The AI primarily acts as a Game Master to facilitate the experience.

What we won’t do

It is not a social platform for strangers, nor does it feature a large number of unrelated mini-games; furthermore, the AI does not completely replace genuine interactions between players.

Strategy Summary

Do

- Focus on existing friend groups
- Center the experience around “Alternate Universe”
- Let player interactions truly influence the outcome
- Use AI to support and drive the experience

Don't

- Serve all types of social needs
- Create a matchmaking service for strangers or a large-scale social platform
- Develop a collection of casual games
- Let AI drive all content and decision-making

Positioning

Alternatives

- Ordinary friendship quiz or party game websites
- Party games like “Truth or Dare” and “Most Likely To”

- Friends chatting among themselves, playing board games, or coming up with questions on the spot to interact
- Having GenAI directly generate party questions or mini-games

Attributes

- Friends themselves are part of the game content
- Players influence characters, relationships, and the story through voting, choices, and interactions
- Alternate Universe provides a unified interactive experience, rather than a collection of scattered mini-games
- The AI advances the experience based on player input, rather than simply generating random questions

Value

- Makes interactions between friends more engaging and personalized
- Helps everyone discover each other's different perspectives and choices
- Makes it easier to generate new topics of conversation, inside jokes, and shared memories
- Every group of friends has a slightly different experience

Who cares a lot

Groups of friends who already know each other and are looking for a fresh way to play and interact together—especially during get-togethers, online chats, or when hanging out.

Category

Interactive Social Game Platform / Website

In other words, a social gaming website centered around group interactions among friends.

Summary

For groups of friends looking to interact in a more fun and engaging way, we are an Interactive Social Game Platform. Unlike typical friendship quizzes, party games, or just coming up with conversation topics on the spot, we let your friends' real choices, votes, and interactions shape characters, relationships, and stories together—giving every friend group its own unique experience.

Do

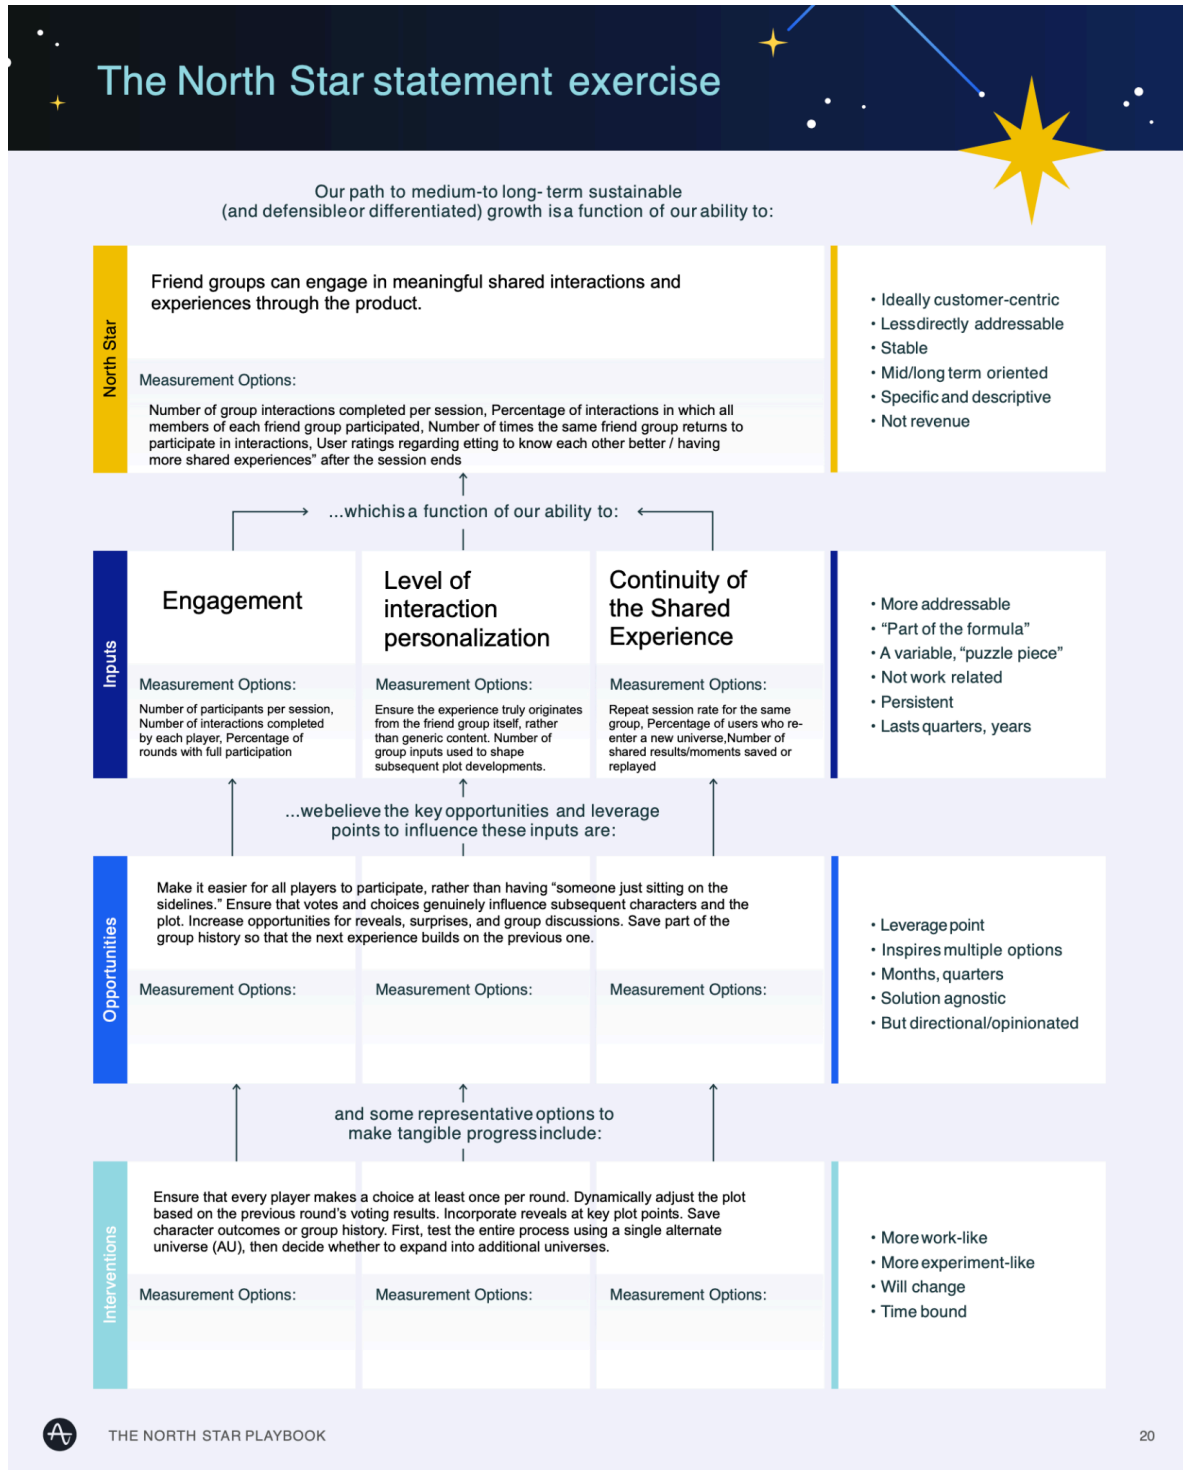

- Start with real-life alternatives
- Emphasize the value of genuine interactions among friends
- Clearly position it as an Interactive Social Game

Don't

- Compare features only with direct competitors
- Position it as a new category that no one has heard of

- Focus solely on specs like AI, voting, and storylines without explaining the value they bring to users

North Star

Rewording North Star metric:

Friend groups can engage in meaningful shared interactions and experiences

Enhancing in person relationships through immersive play experiences.

- **how people who already know each other can become closer, have more things to talk about, and create more shared experiences through interaction.**

Value: the engagement is created [without the pressure of learning complicated role-playing game rules.]
